```python
import math

def distance(x1, y1, x2, y2):
    return math.sqrt((x2 - x1)**2 + (y2 - y1)**2)

def unused_function():
    print("This function is never used.")

print(distance(0, 0, 3, 4))
```

Run Review

What the Code Does

The provided Python code calculates distance between two points on a Cartesian plane. The `math` module in python provides many mathematical functions and constants like e (natural logarithm), pi etc., which can be used to calculate square roots of numbers, hence this line is unnecessary for calculating distances but it's included here just as an example how these might work out with the rest provided code.

```
## Things to Improve
1) The code doesn't handle the case where `x2` and/or `y2` are not provided: if th
   - For instance `math` function does not accept negative numbers as parameters b
